| Growth stage | Positioning for Scale |
| Team | Dr. Amir Tal (Chief Scientist), Amir Nathan (Co-Founder), Yinon Amir (Co-founder, COO, VP R&D) |

Description of product:

Mental health care treatment platform. Our solution enables healthcare providers and caregivers with virtual collaborative care, multi-modal evidenced-based therapy, and data-driven treatment that facilitates and manages their patients' recovery journey. Our solution connects the entire circle of care: primary care physician, psychiatric, therapists, family, friends, and the patients themselves, around a unified treatment plan.

Our technology collects data signals from the caregivers, the person's smartphone and wearable sensors translated to actionable insights, allowing the right treatment to the right person at the right time.

The product has the potential to change the way mental health care is delivered today and enable better caseload productivity, higher efficiency, and better quality of service to achieve a higher outcome.

Project goal:

The goal is to validate the patient adherence and outcome to the care plan for people with a mental or behavioral condition, reduce drop out, better care results and reduce readmissions.

Project type:

A joint case study of deploying our product at the hospital setting for outpatient treatment with mental health issues, the product will be adapted to the hospital workflows, used by the professional care team for the duration of the pilot study. Estimated project duration of 12 to 18 months.

 Eligible by the IIA
